- It would be helpful if Pau dedicated more time in class to going through igraph and how to actually implement the relevant techniques as we are going through the course	8
For a 3 credit course hte workload is enormous. It takes a huge chunk of our time. Pau is a smart and resourceful. HE explains concepts well, the problem i had was with the programming aspect of the problem sets. I found them too challenging as i had never seen one done before the forst problem set.	6
Go slower in the lectures	8
I know the course is tailored to each cohort and their interests, but it also feels like there is way too little time to learn all the concepts - perhaps it would be better to have a 10-week course instead of a 5-week one, but the workload was very fair. So I would keep the amount of problem sets, just make them more spaced out so we could have time to develop them better.	10
I was really excited for this course, but I think it was too much for the short amount of time available. We didn't receive nearly enough of an introduction to the coding aspects of the homework. The homework content was interesting, but the level of complexity/ difficulty could be dialed down and the instructions made clearer. This would allow us a deeper understanding of the more basic concepts. I genuinely think that re-writing the problem set for this class would be helpful.	6
Interesting course, and with nice work by the teachers, but maybe too heavy in terms of work load relative to the other courses that were being done at the same time	8
Networks! fun	8
One of the best courses BSE has, the professor is really good. I think the workload is considerable high for a 3 credit course, but I learned a lot doing the problem sets, so I think it should study transform it a 6 credit course (and do two 6 credit courses like happens with behavioral economics) and maintain the workload. In my case I'm not joining on term 3 because it's too much work in my opinion for a subject that is not so much applied outside the academia.	10
The class is very engaging, though the problem sets were quite extensive and much more challenging than the level of the lectures themselves. It would have been better to spread out the course over 10 weeks, with one class per week, rather than twice a week for the last 5 weeks; this would have allowed more time for students to work through problem sets, especially since the second half of the term is packed in terms of evaluations.	10
The class was interesting and engaging and we learned a good mix of theory and practical applications.	8
The TA should be to helpful to prepare the problem sets given that in the class we only saw the theory and the problem sets include theory and practice. In addition, the problems set should be shorter considering that it is a 3 credit elective and we have other courses at the same time.	6
The workload was too much (in terms of length and difficulty) for a 3 credit course. 4 huge assignments and a final project that is a whole paper is the same kind of evaluation we get in 6 credit courses. In addition to this, because the course was very intensive in terms of time, it made the assignments even more demanding.	4
Too complex, need a couple more classes to integrate knowledge	8

He left out first TA session early when he could have helped us with the next problem set or given us more of an introduction to igragh in python and R. He's a good teacher. Perhaps he doesn't need to tell us that he doesn't like coding and he could instead just help us get better at it - and advise use on best practice when working with graph objects. We didn't get feedback on what we did right/ wrong in the problem sets - even the grade wasn't always clear.

8

Manuel's TA sessions could have been better organized with the material he was presenting. He is knowledgeable and answered specific questions adequately.

8

Very good TA, although I would have liked to see examples of coding exercises done in the past, a=or any example and not us researching online to understand how to start the assignment

8

We need the feedback earlier to be able to learn from our mistakes before the next problem set.
