Excelent subject, but too much workload. The professor tried to adjust it throughout the trimester and asked for feedback from the students, which was very helpful. Instead of making the assignmets shorter I think that it would help to have more help with the coding part of the assignments, which is the one most students get stuck with. We know how to do code but not completely from scratch when it is something we have never seen in our life. Some of us have learned how to code only 6 months before, and it is very hard to be able to achieve a good code that does the desired output. This makes us waste a lot of time making it work and leaves us with very little time to really dig deeper into the theory and understand what is happening behind the code.	5
Pau is a great professor and I really enjoyed his courses. The two networks courses were two of my favorite courses from the entire year. I like the style he had where the lectures were more about applications/papers and the homework was very applied and challenging. I learned a lot throughout the year from this course and from Pau and I'm very happy I chose to take these electives.	5
Pau was awesome, I liked every minute of his lessons. My problem with the lesson came with the application of the knowledge, codewise. It would be nice if the TA did examples using codes to show how easy some exercises could be.	5
There are only so few classes offered within the DSDM program wherein I can say is intellectually stimulating. A lot of students within DSDM struggle because we lack the solid foundations to fully grasp the concepts covered in the class. Nonetheless, we still are able to follow the basic concepts and implement them in the problem sets. The problem sets do take time but they are in fact doable. It would make more sense for the class to be a 6 credit course rather than 3. I think it would retain more students across the two terms if the work involved is given the credit it deserves.	5
Too much work for a 3 credits course	3
